

Disaster Recovery Plan

Infrastructure Centric Data Protection with offsite replication

A member of

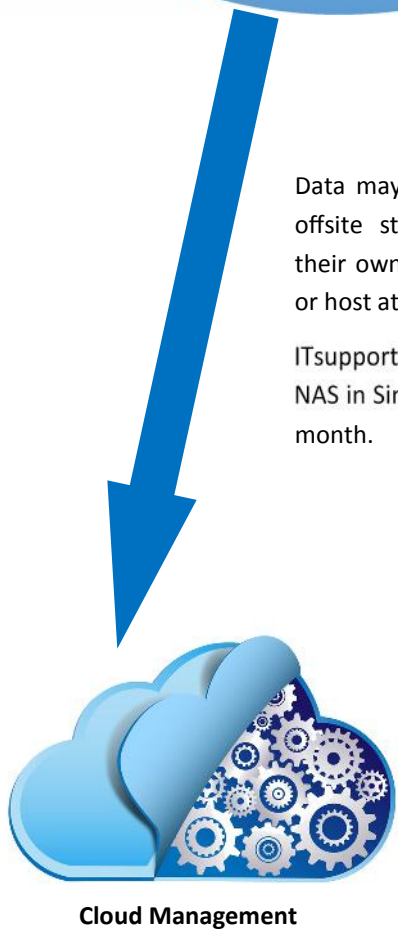

Sync4DR is an Infrastructure Centric Data Protection software which allows customers to replicate data to any Local Storage Device or Network Attached Storage (NAS) and immediately retrieve crucial data in case of disaster, without the need to setup and restore from backup image. It allows users to replicate all files, every single hour of the day (or near-continuously), even when the files are in use.

Sync4DR, when installed onto PC, Notebook and Server, will replicate data to a Network Attached Storage (NAS) or Storage Server. Replication jobs may be set to hourly or daily. Data, even when in use, are replicated intelligently. Only the changed portion of the file is replicated. Data could easily be recovered by copying directly from the NAS.

Data may be replicated directly to the offsite storage. Customer may host their own offsite storage on their own, or host at their preferred site.

ITsupport.sg offers hosting of NAS in Singapore starting at SG\$300 per month.

Sync4DR cloud offers one stop management for all replication activities for all the PCs, Notebooks and Servers. Administrator may create replication policies, manage clients, monitor replication and manage licences.
